Managed AI Workforce Partner Information Pack

MSP PARTNER PROGRAM | EDITION 2.2 | 9 NOVEMBER 2026

Specialist capability for the clients you know

Introduce XoomAgent by XoomAI to help clients perform approved work across their business systems. XoomAI provides discovery, design, deployment and managed delivery; the partner contributes introductions, account context and support within agreed terms.

Now including Fieldy + XoomAgent and XoomTalent

Conversation capture connected to managed AI work, plus fractional human AI specialists for adoption, engineering and senior guidance.

Prepared by	XoomAI
Edition	2.2, partner terms and offer update
Date	9 November 2026
Contact	ai@xoomai.com.au | 1300 040 225

Partner information only. The selected agreement is a commercial draft for legal review before signing. This pack does not replace an executed agreement.

Document control

A capability statement, product guide, client value framework, delivery model and commercial guide for technology advisory partners.

Document	Detail
Title	XoomAI MSP Partner Program, Partner Information Pack
Edition	2.2, 9 November 2026
Prepared for	Managed Service Providers and technology advisory partners
Prepared by	XoomAI, a brand of XoomCloud Pty Ltd
Corporate identity	ABN 37 680 921 162
Contact	ai@xoomai.com.au | 1300 040 225 | xoomai.com.au
Commercial basis	Aligned to clauses 1 to 9 and Schedule 1 of the owner-supplied XoomAI Referral Partnership Agreement, commercial draft for legal review. Binding terms require the applicable executed agreement.

How to use this pack

Leadership teams can use Sections 1, 2 and 8 for strategic fit and economics. Account managers can use Sections 4 and 9 to qualify opportunities. Technical stakeholders can use Sections 3, 5 and 6 for delivery and governance. Sections 11 and 12 explain the new Fieldy and XoomTalent offers.

What changed

Partner terms now use a $1,000 upfront commission after cleared setup payment and 30% of net profit. Approved uplift is shared separately, 70% Partner and 30% XoomAI. The pack clarifies branding and client responsibilities and adds two offer sections. Historical Solo, Lite and Full payment schedules have been superseded for this partner offer.

Contents

Use this pack to identify a suitable opportunity, confirm the operating boundaries and agree the next step.

Section	Page
Document control	2
Executive summary	4
1. Company and capability statement	5
2. Why the MSP partnership exists	7
3. The managed AI Workforce product	9
4. Why clients should deploy an AI Workforce	13
5. Implementation and managed delivery	18
6. Security, privacy and governance	20
7. Client packages and commercial entry points	22
8. MSP Partner Program operating model	24
9. Opportunity identification and sales playbook	26
10. Next steps and source register	28
11. Fieldy + XoomAgent	30
12. XoomTalent fractional AI specialists	31

Executive summary

XoomAI enables an MSP to introduce managed AI capability without recruiting an internal AI delivery practice.

Role-specific AI Employees work within approved systems, knowledge, permissions and escalation rules. The partner identifies the opportunity and contributes client context. XoomAI scopes, implements, supports and bills for the XoomAgent service, and manages the ongoing XoomAI client relationship unless otherwise agreed in writing.

The partner commercial model

A qualifying referral earns AUD $1,000 once the client signs and the setup fee is paid and cleared, plus 30% of net profit from the referred XoomAgent service. The setup fee reference is $5,000 per installation unless XoomAI agrees otherwise. Ongoing share is paid monthly in arrears after cleared client payment. Approved price uplift is calculated separately: 70% Partner and 30% XoomAI, with no double counting unless agreed in writing.

Question	Answer
What does the partner introduce?	A managed AI Workforce configured around approved business work.
Who owns delivery?	XoomAI controls base pricing, client contracts, scope, delivery, billing and support. Partner involvement is agreed in writing.
How is it presented?	XoomAgent by XoomAI. No white-label or rebranding rights are granted.
What else can be referred?	Fieldy + XoomAgent for conversation follow-through, and XoomTalent for fractional human AI expertise. Separate written product-specific referral terms are required.
What does the client buy?	A scoped proposal confirming roles, integrations, onboarding, support and pricing.

Agreement status

The owner-supplied agreement is marked commercial draft for legal review before signing. This pack summarises its commercial basis, does not certify legal readiness and does not amend or execute any contract.

1. Company and capability statement

XoomAI is an Australian AI solutions business focused on converting useful AI opportunities into secure, managed and measurable operating capability.

Who XoomAI is

XoomAI is the AI solutions brand of XoomCloud Pty Ltd, an Australian-owned technology business focused on making AI operational inside real organisations. Our approach combines solution discovery, workflow design, integration, governance, deployment and continuous optimisation so AI Employees can move beyond demonstration and perform approved work reliably in day-to-day operations.

The company's core proposition is practical: identify work that is valuable and repeatable, configure the right AI capability around that work, connect only the approved systems and knowledge, train the people responsible for the process and continue improving the solution after launch. The objective is not to create an isolated demonstration. It is to establish a managed business process with a clear human owner.

Capability statement

Capability area	What XoomAI provides	Client outcome
AI strategy and readiness	Opportunity assessment, readiness scoring, use-case prioritisation, roadmap, governance notes and quick-win planning.	A practical sequence of opportunities tied to business value and delivery readiness.
Managed AI Workforce	Role-specific AI Employees connected to approved knowledge, tools and workflows through XoomAgent.	Operational capacity that can answer, organise, qualify, process, update, coordinate and report.
AI automation	Workflow design, trigger logic, information movement, task creation, approvals, escalation and system updates.	Less repetitive administration and more consistent process execution.
AI analytics	Recurring summaries, exception reporting, operational analysis and management-ready insight preparation.	Faster access to useful signals from existing operational data.
Integration	Connection to productivity, CRM, finance, document, web and API-based systems where approved.	AI capability that works inside the client's technology estate rather than beside it.
Training and adoption	User onboarding, manager education, safe-use guidance, workflow ownership and adoption support.	A workforce that understands how and when to use, review and escalate AI-assisted work.
Support and optimisation	Monitoring, tuning, knowledge maintenance, workflow adjustment, issue response and staged expansion.	A managed service that improves as the organisation, process and data change.

Source: Official XoomAI service and capability pages [1], [3-9].

Who XoomAI serves

XoomAI is designed for organisations that want useful AI capability but do not want to assemble the entire delivery stack themselves. Typical clients are small and mid-sized businesses with established productivity systems, CRM, finance platforms, documents and digital workflows. The solution is especially relevant when service demand, administrative work or information movement is growing faster than the client's ability to add process capacity.

The public industry focus includes legal, financial services, logistics, healthcare, real estate, construction, hospitality, retail and professional services. The underlying model is transferable: find a governed workflow, connect the approved systems, define what the AI Employee may do and retain human accountability for judgement, exceptions and consequential decisions.

Operating principles

01 Outcome before technology
Begin with the business work, current baseline, required change and accountable owner. Select technology only after the operating problem is clear.

02 Managed rather than abandoned
Treat launch as the beginning of operations. Monitor performance, update knowledge, tune workflows and review whether the intended outcome is being achieved.

03 Control before autonomy
Give each AI Employee the minimum knowledge, tools and permissions needed for its role. Add automation in stages and retain human approval where risk or uncertainty requires it.

04 Integration with the real business
Design around the systems, data and hand-offs the client already uses so the AI capability becomes part of the process rather than another disconnected interface.

Source: XoomAI company, XoomAgent and AI strategy pages [1-3].

Engagement governance

Role	Primary responsibility
Executive sponsor	Confirms the business priority, investment case and organisational support for the engagement.
Business owner	Owns the intended outcome, approves operating boundaries and reviews whether the deployment is creating value.
Process owner	Provides the detailed workflow, required knowledge, exception handling and day-to-day operational feedback.
MSP relationship lead	Maintains account alignment, contributes environment context and coordinates broader technology dependencies.
XoomAI delivery lead	Owns specialist discovery, solution configuration, integration, testing, onboarding and managed optimisation.
Security, privacy or legal stakeholder	Reviews the client-specific data, access, retention, compliance and consequential-use requirements.

2. Why the MSP partnership exists

AI demand is becoming part of the client technology conversation. The partnership gives the MSP a credible way to lead that conversation without representing capability it has not built internally.

The account-control issue

When a client asks about AI, the question often begins with one operational frustration: an overflowing inbox, slow lead follow-up, after-hours enquiries, repetitive document handling, inconsistent CRM updates or management reporting that consumes too much staff time. If the incumbent MSP cannot help frame and progress that request, the client may search for a separate AI provider.

The risk is broader than losing one project. A new provider may gain access to business processes, systems, executive stakeholders and the future technology roadmap. The partnership is therefore positioned as an account-strengthening capability. It enables the MSP to introduce a specialist partner while remaining part of the strategic and technical conversation.

Client event	Without a specialist partner	With the XoomAI partnership
The client asks how AI could help	The conversation is deferred, answered only at tool level or referred elsewhere without structure.	The MSP can frame a managed AI Workforce opportunity and arrange specialist discovery.
The client needs a delivery plan	The MSP must recruit, subcontract ad hoc or avoid responsibility for the outcome.	XoomAI supplies a repeatable discovery, build, integration, training and optimisation method.
Security and integration questions emerge	The conversation may fragment between vendors with unclear accountability.	The MSP contributes environment context while XoomAI scopes AI-specific architecture, permissions and governance.
The first workflow succeeds	Expansion may be led by the external provider that delivered the initial project.	The MSP remains involved in account planning and can identify adjacent workflows with XoomAI.

Value created for each party

Party	Value
Client	Access to a managed AI Workforce, specialist implementation, documented controls, onboarding and ongoing optimisation without assembling multiple providers.
MSP	A credible AI offer, greater strategic relevance, protection against capability-led account entry, a new profit stream and specialist support for client conversations.
XoomAI	Warm access to well-understood client environments through partners that already hold trust, IT context and an ongoing account relationship.

Partnership principles

- Clarity of role: the MSP's relationship responsibilities and XoomAI's specialist delivery responsibilities are agreed before the client engagement progresses.
- Transparent opportunity handling: registration, communication, commercial attribution and account ownership rules are documented in the partner agreement.

- No capability theatre: the partnership should make the MSP more credible, not encourage unsupported technical or security claims.
- Joint client value: opportunities are progressed because the workflow is worth solving, not merely because an AI product is available.
- Evidence-led expansion: further roles and workflows are added after adoption, operational evidence and governance are established.

> Core positioning
> Your client does not need another AI tool to manage. The MSP introduces XoomAI to provide a managed AI Workforce tied to real workflows, approved systems and accountable outcomes.

Source: Partnership position and commercials supplied by XoomAI management [10].

3. The managed AI Workforce product

XoomAgent is the managed operating environment for role-specific AI Employees. It connects approved work, knowledge and systems to governed actions and human oversight.

What the client is buying

The client is buying configured operating capability, not access to a generic model. An AI Employee is assigned a business purpose and a bounded set of tasks. It receives work through approved triggers, uses the knowledge and tools required for that role, follows defined instructions, requests human input when necessary and records the outcome.

A package may contain several AI Employees working across one department or multiple workflows. For example, an eight-employee workforce could include an AI Receptionist, Lead Qualification Agent, Follow-up Agent, Customer Support Agent, Inbox Coordinator, Document Processor, CRM Administrator and Management Reporting Agent. The labels make the capability understandable; the implementation is defined by the actual workflow, systems, permissions and required outcomes.

What an AI Employee can do

Capability	Typical work performed
Answer	Respond to routine enquiries, provide approved information, acknowledge requests and direct a person to the right next step.
Organise	Classify inboxes, prioritise requests, structure documents, create tasks and route work to the appropriate queue or person.
Qualify	Collect required information, evaluate it against approved criteria, identify missing context and recommend or initiate the permitted next action.
Process	Extract information, prepare records, compare documents, validate required fields and coordinate repeatable administrative steps.
Update	Create or update approved CRM records, task status, notes, calendars and workflow fields.
Coordinate	Schedule, remind, follow up, hand off between teams and maintain a defined sequence of work.
Report	Compile activity, highlight exceptions, summarise trends and prepare recurring management information.
Assist	Find and synthesise answers from the organisation's approved knowledge and policy sources.

How XoomAgent differs from a chatbot

Dimension	Basic chatbot	XoomAgent AI Employee
Purpose	Respond inside a conversation.	Perform a defined business role or workflow.
Activation	Usually waits for a user prompt.	Can respond to emails, forms, events, schedules, calls or user requests.
Context	Relies on the current session and attached knowledge.	Uses governed role instructions, persistent business context and approved knowledge.
Tools	Often limited to information retrieval.	Can use approved CRM, finance, document, calendar, communication and API tools.
Action	Returns text or a recommendation.	Can draft, create, update, route, schedule, record or escalate within permission boundaries.
Control	Prompt and model configuration.	Role permissions, human approvals, operating rules, monitoring and auditability.
Ownership	Usually a software subscription managed by the buyer.	A managed deployment with onboarding, support and ongoing optimisation.

Source: XoomAgent and conversational AI product pages [2], [9].

XoomAI OS operating architecture

XoomAI OS is the control plane that coordinates incoming work, role instructions, business knowledge, permitted tools, AI Employees, human approvals and monitoring. The following figure is a conceptual operating view. It is designed to explain the relationship between the components; the final client architecture is confirmed during solution design.

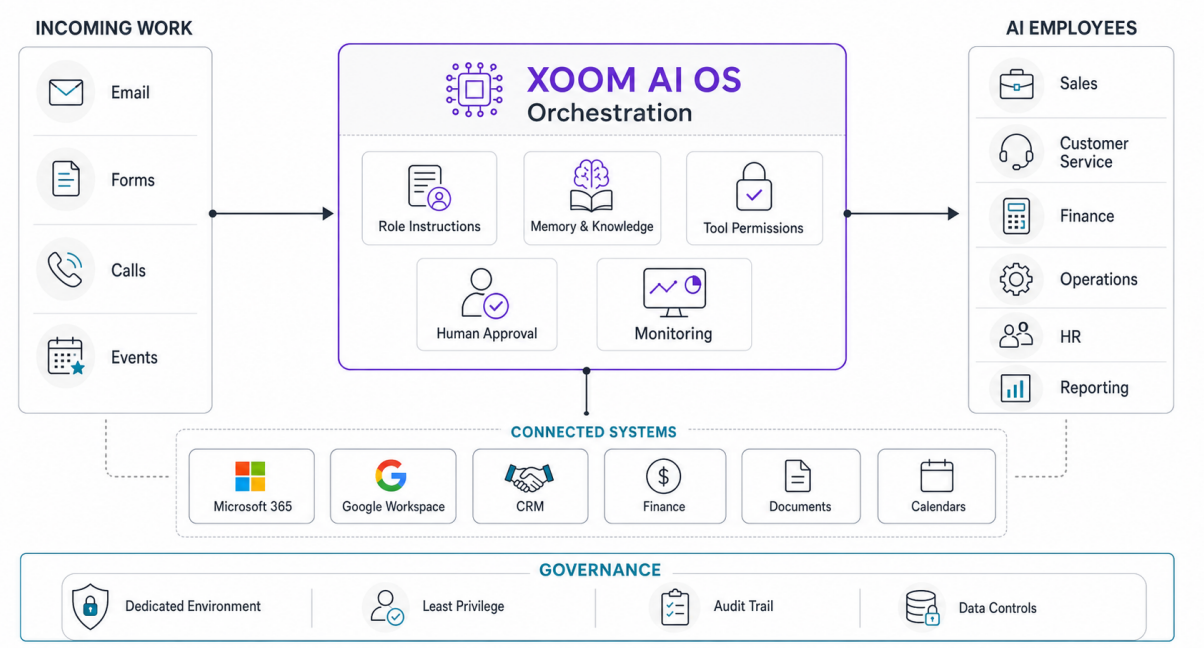

Figure 1. Conceptual XoomAI OS operating architecture. Generated for this information pack from the official XoomAgent product description. It is not a contractual or client-specific technical design.

How work moves through the platform

01 Trigger
An email, form, call, event, document, user request or schedule starts a defined workflow.

02 Interpret
The AI Employee identifies the intent, current state, required information and any missing context.

03 Retrieve
It accesses the approved role instructions, organisational knowledge and records needed for the task.

04 Determine the next action
It applies the configured workflow, thresholds, permission rules and approval requirements.

05 Act or prepare
It completes a permitted action or prepares work for human review, depending on the risk and control design.

06 Escalate
Uncertainty, exceptions, sensitive matters and out-of-policy requests are passed to the nominated person or queue.

07 Record
The outcome, system updates, hand-offs and exceptions are logged for operational use and review.

08 Improve
Performance is reviewed and the role instructions, knowledge, integrations and workflow controls are refined over time.

Source: XoomAgent product and deployment model [2].

The 60-role catalogue

XoomAI maintains a catalogue of 60 deployment-ready AI Employee role patterns. The catalogue accelerates discovery and configuration by providing a practical starting point for common business functions. It does not mean that every client receives an identical agent. Each deployment is adapted to the client's process, knowledge, permissions, integrations and operating controls.

Department	Representative role patterns	Typical outcomes
Management	Executive briefing, meeting preparation, KPI reporting, action tracking and decision-support preparation.	Better visibility, faster preparation and more consistent follow-through.
Sales and growth	Lead research, qualification, outreach preparation, proposal support, follow-up and CRM administration.	Faster lead response, cleaner pipeline data and more consistent cadence.
Customer service	Reception, enquiry triage, first-line support, information collection, ticket creation and feedback routing.	Shorter queues, after-hours coverage and better hand-off context.
Finance	Invoice processing, accounts follow-up, expense preparation, document checks and reconciliation support.	Less repetitive handling, stronger records and earlier exception visibility.
Operations and administration	Scheduling, inbox coordination, document processing, task routing, reminders and workflow administration.	More throughput and consistent completion of routine steps.
HR and people	Employee onboarding, policy assistance, recruitment administration, training coordination and document collection.	More consistent employee service and less administrative follow-up.
Media hub	Content preparation, asset coordination, publishing support, transcript handling and campaign administration.	Faster production support while retaining human approval of public content.
Data and analytics	Data validation, recurring reports, exception summaries, operational analysis and management reporting.	More timely reporting and clearer operational signals.

Selecting a role

Role selection should follow the workflow, not the other way around. A discovery session first identifies the work, volume, delay, systems, decision points and human owner. XoomAI then selects one or more role patterns and configures the specific job. The most credible first deployment is usually a controlled workflow with clear inputs, a repeatable process and a measurable output.

> Role title versus configured capability
> A role title is a communication device. The deployed capability is the combination of purpose, instructions, knowledge, tools, permissions, escalation rules, reporting and human ownership.

Source: XoomAI company and XoomAgent department model [1-2]; catalogue total supplied by XoomAI management [10].

4. Why clients should deploy an AI Workforce

The business case is strongest where repeatable digital work is time-sensitive, high-volume, system-driven and expensive to leave waiting.

The operational case

Most clients do not need to automate the whole business. They need to improve the few workflows that repeatedly create delay, rework, poor customer experience or unnecessary administrative load. An AI Workforce provides new capacity at those points by taking ownership of defined digital tasks and applying the same process each time.

1. Faster response

Routine enquiries, leads and internal requests can be acknowledged, triaged or progressed when they arrive rather than waiting for a person to clear a queue. This is especially useful when the value of the interaction declines with delay.

2. More operational capacity

Skilled staff often spend a meaningful part of the day collecting information, creating records, updating systems, preparing documents and following up. Assigning approved repeatable work to AI Employees allows people to focus on customers, judgement, exceptions and relationship-led work.

3. Selected after-hours continuity

An AI Employee can continue appropriate reception, information, booking, lead and routing workflows outside the normal workday. The design must clearly state what may be completed, what must wait and what requires urgent human escalation.

4. Consistent execution

Role instructions, required fields, approved knowledge and defined escalation create a repeatable operating pattern. Consistency can reduce missing information and make hand-offs easier to understand and audit.

5. Better system discipline

CRM, task and workflow systems only create value when they remain current. AI Employees can help capture notes, create tasks, update status and maintain required information as part of the process rather than as a separate administrative burden.

6. Scalable service

A well-defined digital workflow can handle additional activity without requiring a manual step for every increase in volume. This does not eliminate staff planning; it changes where human capacity is required and helps the organisation absorb growth more deliberately.

Source: XoomAI company, product and strategy pages [1-3].

What makes a suitable first use case

Test	Positive signal	Risk signal
Value	Delay, effort, errors or lost opportunity create a visible business consequence.	The workflow is interesting but has no material operational value.
Repeatability	Inputs, steps and expected outputs are consistent enough to describe.	The process changes completely every time or depends on unstated judgement.
Ownership	A named person can approve rules, exceptions and the target outcome.	No one owns the process or is prepared to review it after launch.
Data and systems	Required information is accessible in approved digital systems or documents.	Critical data is missing, poor quality or inaccessible.
Risk	The first scope can be bounded, tested and reviewed.	The proposed starting point is highly consequential with no practical human control.
Measurement	The current baseline and intended change can be recorded.	Success is defined only as having an AI capability.

Client readiness

Readiness is not a binary technology score. It is a practical assessment of whether the organisation can identify, govern, adopt and support the chosen workflow. A client with modest technical maturity can still be a strong candidate when the process is clear and the owner is engaged. A highly technical client can still be a poor candidate when the use case, data and accountability are unclear.

Dimension	Questions to resolve
Use-case clarity	What job is being improved? Who owns it? What is the baseline? What outcome would justify the investment?
Process	What starts the work? What information is required? What sequence is followed? Where do exceptions occur?
Data	Which knowledge and records are required? Are they current, approved, accessible and suitable for the intended use?
Team readiness	Who will review work, handle escalations, maintain process knowledge and support adoption?
Integration	Which systems must be read or updated? What access is permitted? What licensing and API constraints apply?
Governance	What must a human approve? What should be logged? What privacy, legal or industry obligations apply?

Source: XoomAI AI strategy and readiness methodology [3].

Industry application examples

Industry	High-potential workflow examples	Important qualification
Legal	Client intake, document summaries, matter updates, appointment coordination and governed knowledge retrieval.	Legal advice, privilege, confidentiality and matter accountability remain with qualified people.
Financial services	Document collection, client requests, review preparation, follow-up and recurring reporting.	Financial advice, regulated decisions and recordkeeping obligations require explicit controls.
Logistics	Status enquiries, dispatch updates, exception routing, document handling and recurring operational summaries.	Time-critical exceptions and safety-related decisions require clear escalation.
Healthcare	Non-clinical enquiries, scheduling support, information routing, document administration and patient service follow-up.	Clinical decisions and sensitive health information require strict scope and governance.
Real estate	Lead response, inspection coordination, listing enquiries, CRM follow-up and vendor reporting preparation.	Public communications, representations and sensitive negotiations need human oversight.
Construction	Tender administration, supplier follow-up, document control, project updates and recurring reporting.	Site safety, contractual and certification decisions stay with responsible personnel.
Hospitality	Guest enquiries, booking support, feedback routing, event coordination and operational checklists.	Escalation is required for complaints, emergencies and discretionary service recovery.
Retail	Product enquiries, service triage, order updates, campaign administration and knowledge support.	Product claims, refunds and unusual customer matters follow approved policy.
Professional services	Lead intake, proposal preparation, project administration, meeting preparation and knowledge support.	Professional judgement, advice and client commitments remain human responsibilities.

Source: XoomAI industry pages [1], [7].

Example eight-employee AI Workforce

The following example shows how eight roles can work together in a service-led business. It is illustrative rather than a pre-defined bundle. The final composition is selected after discovery.

AI Employee	Primary responsibility	Typical hand-off
AI Receptionist	Acknowledges inbound enquiries, captures required context and routes the request.	Escalates urgent, sensitive or unclear matters to the nominated team.
Lead Qualification Agent	Collects and checks qualification information against approved criteria.	Creates a qualified opportunity or requests human review.
Follow-up Agent	Maintains approved contact cadence and records responses.	Hands engaged prospects to a salesperson with context.
Customer Support Agent	Answers approved first-line questions and creates service records.	Escalates exceptions and unresolved matters to support staff.
Inbox Coordinator	Classifies, prioritises and routes incoming business email.	Assigns work to the correct queue or person.
Document Processor	Extracts and structures information from approved forms and documents.	Flags missing, inconsistent or low-confidence information.
CRM Administrator	Creates and updates approved records, notes, tasks and status fields.	Queues exceptions where the required record cannot be safely updated.
Management Reporter	Compiles activity, exceptions, response and workflow summaries.	Provides management with a review-ready report.

Measurement framework

Measure	Baseline question	Evidence to review
Response	How long does work wait today?	Median first response, queue age, after-hours backlog and time to hand-off.
Volume	How many items enter the workflow?	Emails, calls, leads, documents, tickets, tasks or transactions per period.
Effort	How much staff time is required?	Average touch time, repeated entry, number of hand-offs and rework.
Quality	Where does the process fail?	Missing fields, returned work, duplicate records, corrections and escalation rate.
Business result	What outcome follows the workflow?	Booked meetings, qualified leads, completed documents, resolved requests or retained customers.
Experience	What does the user notice?	Speed, clarity, accessibility, consistency and quality of hand-off.

A responsible ROI model

The financial case should compare the current cost and consequence of the workflow with the package fee, implementation effort and expected operational change. Benefits should be treated as hypotheses until measured in the client's environment. Where the principal benefit is service quality, capacity or reduced opportunity loss, the model should state that clearly rather than forcing every outcome into a labour-replacement calculation.

Benefit categories

Category	How it may create value	Evidence required
Capacity	Returns staff time from repetitive handling and allows the existing team to absorb more work.	Current touch time, volume, AI-handled proportion and residual human effort.
Speed	Reduces waiting time for leads, customers, employees or operational requests.	Baseline and post-launch response, queue age and completion time.
Quality	Improves completeness, consistency and adherence to required process steps.	Missing data, corrections, rework, duplicate records and escalation trends.
Opportunity	Improves follow-up, coverage or conversion where delay previously caused loss.	Qualified opportunities, booked meetings, completed applications or retained requests.
Experience	Provides faster, clearer and more accessible service to customers or staff.	Feedback, complaints, resolution quality and hand-off context.

Commercial decision rule

Proceed when the expected operational benefit is credible, the first workflow can be governed and the client is willing to measure the result. Do not proceed solely because the technology can perform a task.

> Outcome definition
> Before deployment, record the job, current baseline, target, permitted actions, escalation rules, accountable owner and review cadence. If these cannot be stated, the use case is not ready.

Source: XoomAI AI strategy and analytics pages [3], [5].

5. Implementation and managed delivery

XoomAI uses a staged method to move from opportunity discovery to controlled operation and ongoing improvement.

1. Audit

The audit identifies the business workflow, owner, current baseline, systems, knowledge, risks and intended outcome. The purpose is to select a scope that is valuable, practical and governable. Discovery should also reveal missing process documentation, data issues and integration constraints before a build commitment is made.

2. Build

XoomAI configures the selected role patterns, operating instructions, knowledge sources, tool access, workflow logic, approval points, escalation conditions and reporting. Test cases cover normal work, missing information, exceptions and failure paths.

3. Integrate

Approved systems and channels are connected using the minimum practical access required by the workflow. Integration testing confirms that information is read, created and updated correctly, credentials and permissions behave as intended and errors are routed to an accountable person.

4. Train

Users and managers learn what the AI Employee does, what it does not do, how to review work, how to respond to an escalation and how issues are reported. The responsible business owner confirms the operating procedure and the adoption plan.

5. Optimise

After launch, XoomAI reviews workflow performance, exceptions, user feedback, knowledge changes and the agreed outcome measures. Prompts, role instructions, integrations and process controls are adjusted deliberately. Additional roles or automation are considered only after the initial operation is stable.

Delivery responsibilities by phase

Phase	Client	MSP	XoomAI
Audit	Provides process owners, workflow context, data and outcome requirements.	Provides account and IT environment context; joins discovery as agreed.	Leads workflow, value, readiness, integration and risk discovery.
Build	Reviews operating rules, knowledge, approvals and test cases.	Coordinates relevant technical stakeholders and access context.	Configures roles, workflows, knowledge, tools, controls and testing.
Integrate	Approves access and supports application owners.	Supports identity, network, security and incumbent-system coordination where applicable.	Implements and validates AI-specific integrations and end-to-end workflow behaviour.
Train	Nominates owners and users; adopts the operating procedure.	Participates in enablement and support alignment as agreed.	Delivers role, control, exception and user training.
Optimise	Provides feedback and reviews operational outcomes.	Includes AI in account planning and identifies adjacent needs.	Monitors, supports, tunes and reports on the managed service.

Go-live criteria

- The workflow purpose, owner and target outcome are documented.
- Approved knowledge sources and required system access are available.
- Normal, exception, missing-information and escalation tests have passed.
- Human approval and escalation responsibilities are understood.
- Users know how to identify, review and report AI-assisted work.
- Operational monitoring, issue handling and review cadence are agreed.

> Scope before speed
> The first deployment should prove one controlled workflow. Expansion follows evidence, adoption and agreement, not a blanket promise to automate the organisation.

Source: XoomAI five-stage delivery model and XoomAgent deployment approach [1-3].

6. Security, privacy and governance

Production AI requires explicit decisions about identity, data, permissions, human accountability, auditability and ongoing ownership.

Security model

XoomAI's public product position emphasises dedicated infrastructure, controlled access, Australian data considerations, no training on client data, audit trails and human review. These principles provide the starting point for solution design. The exact architecture, model providers, retention, data location, access paths and compliance requirements must be confirmed for each client.

Principle	Design intent	Questions confirmed during scope
Dedicated environment	Separate client workloads from casual shared-chat usage and support client-specific configuration.	What is isolated? Where is it hosted? Which provider services are involved?
No training on client data	Prevent client content from being used to train public foundation models.	Which model terms apply? What logging and retention occur in each component?
Least privilege	Give each AI Employee only the systems, records and actions needed for its approved role.	Which identities are used? Which scopes and fields can be read or changed?
Governed knowledge	Limit responses and decisions to approved business sources and instructions.	Who approves knowledge? How are changes, expiry and conflicts handled?
Human approval	Require people to review sensitive, uncertain or consequential work.	Which thresholds require approval? Who acts when an approval is delayed?
Auditability	Record actions, system changes, hand-offs and exceptions for operational review.	What is logged? Who can access it? How long is it retained?
Data controls	Address privacy, sovereignty, retention and appropriate handling for the specific workflow.	What personal, confidential or regulated data is involved and what obligations apply?
Ongoing management	Keep access, knowledge, integrations and controls current after launch.	Who reviews access, exceptions, changes, incidents and performance?

Human-in-the-loop design

Human oversight should be designed into the workflow rather than added as a vague disclaimer. A role can operate in several modes: prepare work for approval; complete low-risk actions within a threshold; ask for missing information; stop when confidence is insufficient; or escalate defined categories immediately. The appropriate mode depends on the consequence of error, reversibility, data sensitivity and the client's policies.

Governance questions for every client

- Who is accountable for the business outcome and the correctness of the workflow?
- Which decisions or communications must always be reviewed by a person?
- What information may the AI Employee access, and what is explicitly prohibited?
- What systems may it update, which fields may change and what approvals are required?

- How are incidents, unexpected behaviour and customer complaints handled?
- How are role instructions, knowledge, permissions and integrations changed and approved?
- What evidence is retained for operational, legal, privacy and security review?

> Important qualification
> This pack is not a security certification, privacy assessment or legal opinion. Client-specific controls must be documented and approved before production use, especially in regulated or consequential workflows.

Source: XoomAI company security statements, XoomAgent deployment model and Claude integration page [1], [2], [8].

Integration environment

The AI Workforce is intended to operate where work already lives. Integration is therefore a core design activity, not an optional add-on. Availability depends on the client's licensing, system configuration, API capability and security requirements.

System group	Representative platforms and channels	Typical use
Productivity	Microsoft 365, Google Workspace, Outlook, Gmail and SharePoint.	Email, documents, internal knowledge, calendars and collaboration workflows.
Customer systems	HubSpot, Salesforce, websites, forms and service platforms.	Lead intake, customer records, service requests and workflow status.
Finance	Xero, MYOB and approved finance workflows.	Invoice, document, accounts and reporting support.
Coordination	Calendars, notifications, forms, email and task systems.	Scheduling, reminders, routing, approvals and hand-offs.
Automation	Make.com, Zapier, webhooks and scheduled workflows.	Orchestration between systems where appropriate.
Custom	REST APIs, internal systems, databases and approved knowledge stores.	Client-specific workflows that require tailored integration.

The integration rule is simple: do not connect a system because it is technically possible. Connect only what the approved workflow needs, with the minimum practical permissions, tested error handling and a named owner.

Source: XoomAI company, XoomAgent and AI automation pages [1], [2], [4].

7. Client packages and commercial entry points

Select roles around the client workflow. Confirm the actual scope and price in the client proposal.

Package	Current monthly entry point
AI Foundation	4 AI Employees, $1,399 + GST per month
AI Workforce	8 AI Employees, $2,399 + GST per month

Setup and implementation

The selected partner agreement uses a standard setup fee reference of AUD $5,000 per client installation unless otherwise agreed by XoomAI. Any different onboarding fee must be confirmed by XoomAI in the client proposal. Do not use older package setup fees or partner onboarding schedules as a promise.

What is confirmed during scope

Agree the role mix, process boundaries, connected systems, knowledge, access controls, human review points, delivery milestones, usage costs and support arrangements. Employee count does not imply unlimited integrations, implementation, support or automation.

Partner payments are independent of role count

The qualifying upfront referral commission is $1,000 after cleared setup payment, with a 30% trailing share of net profit under the agreement. It is not a $1,000/$2,000 package-based schedule. See Section 8 for eligibility, costs, exclusions, reporting and uplift.

Other entry points

Fieldy hardware, applicable Fieldy plans and managed roles are quoted for the client. XoomTalent supplies assigned human specialists with a defined monthly hours allocation. Their referral fees and attribution must be agreed separately in writing.

Sources: current MSP Partnership page for monthly workforce entry points; owner-supplied agreement clauses 2 to 6 and Schedule 1 for partner terms and setup reference. All amounts AUD, excluding GST.

From qualification to managed operation

A package is a starting point for discovery, not a substitute for a scoped client proposal.

Step	What is confirmed
1. Initial conversation	Business bottleneck, process owner, current systems and reason to act.
2. Qualification	Value, repeatability, accessible information, risk and client sponsor.
3. Discovery	Intended outcome, baseline, role mix, permissions, review points and integration feasibility.
4. Proposal	Client setup and monthly fees, inclusions, usage, support, implementation and exclusions.
5. Onboarding	Configure, integrate and test approved workflows; train the client and agree launch readiness.
6. Ongoing operation	Monitor outcomes, address exceptions and prioritise improvements within agreed scope.

A practical qualification brief

Send the client name, agreed introduction, business problem, sponsor, current systems, approximate volumes and intended result to XoomAI. Register the referral before engagement and check whether it is already known to XoomAI.

Commercial boundaries

The partner cannot bind XoomAI or make unapproved pricing, delivery or contractual commitments. XoomAI controls base pricing, contract, service scope, timelines, support, billing and account management. Any approved uplift must be disclosed to and accepted by the client without creating unapproved delivery obligations.

8. MSP Partner Program operating model

The partner brings an introduction and relevant account context. XoomAI provides the specialist AI lifecycle.

Stage	Responsibilities
Target and introduce	Partner identifies fit, obtains client permission and records the referral. XoomAI checks eligibility and confirms the next discovery step.
Discover and propose	Partner contributes relationship and environment context. XoomAI leads scoping and prepares the client proposal.
Deploy and operate	XoomAI owns approved configuration, implementation, testing, training, support, billing and ongoing XoomAI client management. Partner supports access or account coordination where agreed.
Expand	Partner may identify adjacent needs. XoomAI validates value and agrees scope before adding roles or workflows.

Brand and client relationship

XoomAgent must be presented as XoomAgent by XoomAI. The agreement grants no white-label, rebranding or own-product rights. Referred XoomAgent clients are clients of XoomAI unless otherwise agreed in writing. Partner introductions, sales support or relationship assistance can be agreed without changing these boundaries.

Opportunity qualification and account protection

A qualifying referral is introduced by the partner, is not already an active opportunity, existing client or known XoomAI prospect at referral, signs with XoomAI and pays cleared funds. The agreement includes confidentiality and mutual restrictions concerning clients and services. Review the actual agreement for their scope; this pack does not expand those restrictions or promise unrestricted account ownership.

Source: owner-supplied agreement clauses 1, 7 to 12 and Schedule 1. Commercial draft for legal review before signing.

Partner commercial model

Summary of the owner-selected agreement. The applicable executed agreement governs actual entitlements.

Component	Terms
Setup fee reference	AUD $5,000 per client installation unless otherwise agreed by XoomAI.
Upfront referral commission	AUD $1,000 per qualifying referred client after setup payment is received and cleared.
Trailing commission	30% of net profit from the relevant referred XoomAgent service.
Net profit	Revenue actually received less direct delivery costs, including software, infrastructure, API usage, contractor, support and implementation costs attributable to the client.
Approved uplift	70% Partner / 30% XoomAI, calculated separately. Do not double count it for the trailing commission unless agreed in writing.
Payment and reporting	Monthly in arrears after cleared client payment, with a reasonable summary of relevant revenue, direct delivery costs, net profit and commission.
Duration	No minimum client term for commission eligibility. Trailing share continues while the qualifying client remains active and paying, subject to exclusions, including after partner termination.

Exclusions

No commission is payable on GST, taxes, refunds, chargebacks, unpaid or disputed amounts, pass-through expenses or third-party costs not retained by XoomAI. Referral eligibility, material breach and other exclusions in the agreement apply.

Worked example, actual costs must be recorded

If a month has $2,399 in received base-service revenue and $1,000 in attributable direct delivery costs, net profit is $1,399 and the trailing commission is $419.70. A separate $300 approved uplift, after its applicable exclusions, gives $210 to Partner and $90 to XoomAI. The uplift is excluded from the $1,399 calculation. These inputs illustrate arithmetic only, not an expected margin or guaranteed return.

Source: agreement clauses 2 to 7, 13 to 14 and Schedule 1. All figures AUD excluding GST. The upfront $1,000 is separate from this monthly example.

9. Opportunity identification and sales playbook

The best referral begins with a business problem, not a request to demonstrate AI.

Buying signals

What the client says	Likely opportunity	Useful next question
We are drowning in email and follow-up.	Inbox coordination, lead response, task routing and recurring follow-up.	Which messages wait the longest and what should happen when they arrive?
We need to respond after hours.	Reception, enquiry handling, booking and service triage.	What can be safely completed after hours and what must be escalated?
Staff enter the same information everywhere.	Document processing, CRM administration and workflow integration.	Which information is re-entered, where does it originate and which system should remain authoritative?
Our CRM is never up to date.	Activity capture, task creation, field updates and management reporting.	Which records matter most and what prevents staff from maintaining them today?
We cannot find answers in our documents.	Governed knowledge assistance and document retrieval.	Which sources are approved, current and owned?
We are hiring because administration keeps growing.	Operational capacity across repeatable digital work.	Which tasks consume the most time and which require real judgement?
Lead response is inconsistent.	Lead qualification, follow-up and CRM workflow.	How quickly should a lead be contacted and what information defines a qualified opportunity?
Reporting takes days every month.	Data collection, validation, exception reporting and management summaries.	Which systems contain the inputs and what decisions depend on the report?

Ten discovery questions

- What work repeatedly waits in a queue?
- Where does slow response create customer dissatisfaction or lost opportunity?
- Which administrative task consumes the most skilled staff time?
- What process is repeated often enough to describe and test?
- Who owns that process and can approve the operating rules?
- What systems, documents and data does the work depend on?
- What must always be reviewed or decided by a person?
- What volume, response, effort or quality baseline can be measured today?
- What change would make the investment worthwhile?
- What business event or timing makes the client ready to act now?

Common questions and activation

Use a scoped, evidence-based conversation and agree terms before commitments.

Question	Response
Is it just a chatbot?	Chat can be a channel. XoomAgent performs approved work across connected systems under role instructions, permissions and review rules.
Can it use existing systems?	Common business tools and approved APIs can be assessed during discovery. Confirm each integration before committing.
What needs human review?	The client and XoomAI agree approval points, exceptions and escalation for consequential actions.
Who supports it?	XoomAI owns specialist implementation, ongoing delivery and support within the client agreement.
How is the partner paid?	$1,000 after cleared setup payment for a qualifying referral, plus 30% of net profit. Approved uplift is separately split 70% Partner / 30% XoomAI. See Section 8.
Can it be white-labelled?	No. Present XoomAgent as XoomAgent by XoomAI.

30-day activation guide

Week 1: Review and finalise the agreement, nominate owners and confirm opportunity rules, commercial terms and brand presentation. Enable client-facing staff on the offer and its boundaries.

Week 2: Identify suitable client accounts with clear operational problems and sponsors. Use existing account conversations to qualify fit and obtain permission for introductions.

Weeks 3 and 4: Register the strongest opportunity, run joint discovery, establish a baseline and agree the scoped next step. Prioritise one useful, governed workflow before expanding.

The timing is a suggested guide. It is not a deployment commitment or an instruction to contact clients without authority.

10. Next steps and source register

Align the partnership, enable the client-facing team and scope the first suitable opportunity.

1. Partner alignment: Confirm the actual agreement, commercial rules, permitted presentation and accountable owners.

2. Enablement: Review AI Workforce, Fieldy + XoomAgent and XoomTalent use cases, referral fit and approval boundaries.

3. Account review: Identify a business problem with a sponsor, useful baseline and accessible systems.

4. Joint discovery: Agree outcome, roles, integration, delivery scope, costs and governance before committing.

Contact

ai@xoomai.com.au | 1300 040 225 | https://xoomai.com.au/

Offer pages and monthly entry points checked 9 November 2026. Retained capability sections describe the general model; client-specific architecture, controls, integrations, service levels and outcomes must be confirmed during scope.

Important notes

This pack is for partner assessment, enablement and client-conversation support. It does not replace a client proposal, statement of work, architecture design, security assessment, privacy review, legal advice or executed partner agreement. Product scope, integrations, data handling, deployment timing, service levels and commercial terms are confirmed for each engagement.

Representative role and industry examples are illustrative and do not guarantee suitability or outcome. References to dedicated infrastructure, no training on client data, data location and other controls describe the public XoomAI product position; the exact implementation must be confirmed for the client. Pricing excludes GST and should be reconfirmed before a client commitment is made.

XoomAI is a brand of XoomCloud Pty Ltd | ABN 37 680 921 162.

Before using this pack

- Confirm the current package pricing and commercial offer before making a client commitment.
- Use the executed partner agreement for opportunity registration, profit definitions, payment timing and account-handling rules.
- Do not represent this pack as a client-specific architecture, security assessment or compliance approval.
- Bring XoomAI into discovery before committing integrations, delivery timing, data handling or automation scope.
- Describe representative roles and workflows as examples until they are confirmed in the client proposal.

Contact and corporate details

Item	Detail
Trading brand	XoomAI
Legal entity	XoomCloud Pty Ltd
ABN	37 680 921 162
Partner enquiries	ai@xoomai.com.au

> Discuss a partner opportunity
> Send the client name, business problem, process owner, current systems and reason to act to ai@xoomai.com.au. XoomAI can then help determine whether the opportunity is ready for discovery.

11. Fieldy + XoomAgent

Conversation context becomes useful work for the right AI Employee.

What the offer does

Fieldy 3 is a wearable conversation capture device used with the Fieldy app. Transcripts, summaries and searchable context help retain commitments. XoomAgent connects relevant context to reminders, tasks and work for configured AI Employees, within the client's connected systems and approval rules.

What a partner can refer

Clients whose meetings, site visits or mobile work create follow-up gaps may benefit from a scoped discussion. An illustrative workflow is a client conversation becoming a proposal task for Sales, a reminder for an Executive Assistant and an approved CRM update. These examples depend on confirmed integrations, roles and permissions.

Discovery and delivery

Provide the business problem, client permission for the introduction, process owner and current systems. XoomAI assesses feasibility and quotes the hardware, applicable Fieldy plan and managed AI roles. Scope and costs are agreed before deployment.

Capture, access and approvals

Choose appropriate conversations and obtain required permissions before recording. Confirm processing, access and retention, including Fieldy's own terms and data settings. Agree which messages, documents and system changes need review, and where human judgement or escalation is required.

Referral economics

Agree product-specific referral scope, fees, attribution and payment triggers in writing before introduction. The XoomAgent referral schedule does not automatically grant commission on Fieldy hardware or third-party subscriptions. Only agreed written terms determine payment.

Source: https://xoomai.com.au/fieldy, checked 9 November 2026. Available from XoomAI, with client-specific setup and managed delivery.

12. XoomTalent fractional AI specialists

Assigned human AI expertise with an agreed monthly allocation, managed by XoomTalent.

Introduce XoomTalent when a client needs adoption support, workflow implementation or senior AI direction without a full-time hire. The client nominates a sponsor and priorities; XoomTalent confirms specialist capability, availability, location and delivery scope.

Tier	Monthly fee / hours / typical work
AI Assist	$1,250 / 8 hours. Existing assistant configuration, prompt and knowledge refinement, coaching and covered-tool troubleshooting.
AI Operations	$2,500 / 11 hours. Assist scope within hours, supported integrations, bounded scripting, agent setup, testing and handover.
AI Partner	$4,500 / 13 hours. Operations scope within hours, roadmap, sponsor engagement, documented-API integrations and governance review.

Capacity and costs

Minimum pricing covers 1 to 10 staff. Each additional covered staff member adds $50 and 0.5 hours for Assist, $100 and 0.75 hours for Operations, or $150 and 1 hour for Partner. Above 50 staff, capacity is confirmed before quoting. Approved extra time is $169, $229 or $350 per hour respectively, within the selected tier.

All amounts AUD excluding GST. Software, hosting and AI usage are additional client-funded costs. Meetings, testing, documentation and reporting use allocated hours. Scope, onboarding, term, scheduling and hour policies are agreed in the proposal. Additional time requires an approved estimate and spending cap.

What a partner can refer

Confirm a business problem, sponsor, covered team size, budget and desired first outcome. With client permission, register the opportunity and agree partner involvement before introduction. This is human specialist capacity, not an AI Employee subscription or a full-time placement.

Referral economics

Fees, payment triggers, attribution and ongoing involvement must be agreed in writing before introductions. No standard commission or exclusivity is published for XoomTalent. Do not apply XoomAgent profit share to specialist labour without separate written terms.
